EXPLOREQ: Is there a list of
constraints to invoke nullable
reference types? I am using F#
with CodeDOM. When
building a constraint, it looks
like I have to provide null as
the second parameter for a
nullable reference type. Is this
the only way to provide a
constraint or is there another
way to do it? Here is an

example: let (l:SafeString|_|) (l:string option) (d:Nullable()) :string = match l with | None -> d.Value | Some l -> l.Value let (l:SafeInt32|_|) (i:int option) (d:Nullable()) :int = match i with | None -> d.Value | Some i -> i.Value It is odd to me that I have to provide null for the second parameter, even though, in the implementation I should be able to provide it any reference type? A: The documentation lists other

constraints: The only way to constrain a reference type is to provide the type as a constraint parameter (and this must always be followed by an explicit null-literal in F#). It is important to note that even in the face of the following error message, the constraint you put on an identifier will always bind to the null value: The constraint on type string does not have the required constraint 'A:' to the null literal

type int32 ..., and the other answers to this question that explain how to handle the constraint with a nullable type are good for F# 3.0. With F# 4.0, it is possible to work around this problem by using a type-class approach: type 'a Safe = static member Create (x: 'a option) = match x with | None -> Nullable.Create Nullable.default | Some x -> x

Osteoporosis in men. A healthy lifestyle includes regular

exercise and adequate intake of calcium and vitamin D. Exercise helps balance a calcium deficit and vitamin D deficiency. Calcium and vitamin D replacement are beneficial for improving bone health in patients who are deficient, as well as for preventing osteoporosis.
