Apr 15, 2008 Communication systems where there is a direct line of sight (LOS) between a transmitter and receiver employ Frequency-modulated waveforms. Examples of these systems are radar, television, microwave ovens, and FM radio. In contrast, wireless communications systems are of two main types: those where the transmitter and receiver are not directly visible to each other and those where the transmitter and receiver are visible, such as TV and FM radios. In the first type of system, which we will call a multipath system, multiple reflections of the transmitted waveform are used to achieve the desired communication. These reflections are the result of multipath propagation which we will discuss shortly. In the second type of system, multiple antennas or receive antennas are used. For example, in a radio station's antenna array, many antennas might be pointed in different directions. Thus, all receive antennas receive many different radio waves. Each receive antenna receives radio waves from different directions, just like the FM radio in your car. Although you hear only one FM radio station, the radio station is actually broadcasting over many frequencies at the same time
