MLB 12: The Show.1. Field of the Invention The present invention relates to a process for manufacturing a thin film transistor array substrate and a thin film transistor array substrate manufactured by the same, and more particularly, to a process for manufacturing a thin film transistor array substrate and a thin film transistor array substrate manufactured by the same, in which a crack, which can be generated during a rubbing treatment for the rubbing treatment of a black matrix layer which is formed on a substrate to form color filters, is prevented from being generated. 2. Description of the Related Art Recently, flat panel displays have been developed which have a reduced weight and occupy a smaller area than cathode ray tubes (CRTs). Flat panel displays include liquid crystal displays (LCDs), organic light emitting devices (OLEDs), field emission displays (FEDs), plasma display panels (PDPs), and vacuum fluorescent displays (VFDs). Among these flat panel displays, liquid crystal displays have many advantages in that they are a light-weight, thin, and large-sized and occupy a small area. Furthermore, since liquid crystal displays themselves are non-emissive, backlights are required for the liquid crystal displays. When a backlight is turned on, the liquid crystal displays display an image using an optical modulation effect of liquid crystals. Meanwhile, since organic light emitting devices (OLEDs) have an advantage in that they can be driven by a direct current voltage, to which there is no limit of a voltage as there is in the case of a liquid crystal display, the organic light emitting devices can be driven with a relatively low power consumption. Also, the organic light emitting devices have advantages in that they are light in weight, have a high response speed, have no limitation of a viewing angle, and have a high degree of freedom in color expression. In addition, OLEDs have advantages in that they can be freely manufactured on flexible substrates, and have a small size and a small thickness of devices themselves. Furthermore, since there is no need for a backlight, OLEDs can be manufactured with a very thin thickness, have excellent color expression, and have a high contrast ratio. In particular, OLEDs have an advantage in that they can be mass produced at a low cost since all the devices are formed of organic materials. Since OLEDs can be driven with a low power consumption, they have recently been widely developed as next-generation display devices to replace CRTs. However, in general, the f30f4ceada
