WinTSD is a freeware piece of software designed to help users increase the security of their files by encrypting them and constantly monitoring them for unauthorized access. A professional-grade tool The application has been built mainly for professionals, allowing them to secure important documents and files and to keep an eye on the applications trying to access them. The tool takes advantage of transparent encryption, and automatically encrypts or decrypts data when the user wants to access it, all in the background. WinTSD creates a TSD file in which users can save the documents they want to encrypt, and which can be saved anywhere on hard disks, DVDs, or USB sticks. Documents stored inside it can not be viewed by other users unless WinTSD is used to gain access to them. Intuitive interface To get started with the application, users need to click on its System Tray icon, and then create a new TSD file, provided that one is not already available. After creating the file, they simply need to move all the documents they want to secure to it, and they are good to go. The program comes with a real-time monitor, which informs users on the unauthorized applications that are trying to access the secured documents. When trying to access an encrypted file, users are also asked to enter an unlock code, as the application uses captcha to ensure that the document is not being accessed by a bot. The tool can also be used to monitor the computer's network status. Fast, but sometime unstable performance The tool has been designed for users who posses at least some computer knowledge, and feels quite fast, though it did froze a few times during our testing, which resulted in the entire system becoming unresponsive. All in all, WinTSD is a fairly easy-to-use application designed to help users encrypt their documents so as to ensure that they are not being accessed by unauthorized people or applications. It also includes a built-in monitor that informs users of any access attempt in real time. WinTSD main features: Intuitive interface Transparent encryption Real-time monitor Unlock with captchas Installed Unknown Free to try for 30 days Unable to get to trial Review: In technical terms, there are two kinds of encryption: symmetric and asymmetric.
