We have found that every common method can be implemented using the following steps: E.g. xxd -d16 -g4 with the 32-bit version of xxd is used in the following example. xxd -d16 -g4 ltr '\r' ' ' This command is used to view the contents of the encrypted file. The original content is hidden. The output file is in ASCII format, but the user can view the file using a hex editor. In the case of xxd there is also a command-line switch -r option that displays the original content without removing the lines. xxd -r The command line switch -f option was used to view the raw encrypted data and identify the format of the data (e.g. the password string) xxd -f The user can use the search command line switch --search and the input file to search for the encrypted data. The output file will include the first match. xxd -s inputFile.txt |grep "password" The encryption method used to encrypt the file is identified with the -x option. xxd -x The encryption key can be found with the -k option.
