Keymacro is a source of flicker which is based on a combination of keyboard & mouse actions. It includes a waveform editor, a meta-chord editor, a metacontrast / flicker duration control and a beat-tracking control. You can also use the waveform editor to

create your own beat-tracking display. When Keymacro is launched, you are given the option of either creating a new display, or starting from a saved display that you created with the Keymacro Editor (see The Keymacro is designed to be used with a fairly standard mid-range computer keyboard, and while some keyboards may offer a different level of flicker, they usually lack the control features found in Keymacro. If you would like to use a different keyboard, you can use the program to generate a virtual keyboard, which can then be imported into your home made keyboard layout. You can also run Keymacro without a keyboard by holding down a key on your mouse, so you can use Keymacro with your keyboard, and mouse, simultaneously. The Keymacro Editor, which is also available from is a user-friendly, Mac-only program which allows you to generate Keymacro displays for your own use. Keymacro is designed to create very realistic visual effects that will challenge your sense of perception. Some examples of these include: ⬜ 'Faux 3D': when displayed with a slow shutter speed, you will notice that objects appear to have depth; ⬜ 'Rolling Clouds': objects seem to 'unfold' in space in a way that mimics the movement of clouds across the sky; ⬜ 'Snowflakes': when seen through snow falling in winter, you will notice that every object in the scene, including falling snowflakes, appears as a glowing, white, point-light. Keymacro also includes a unique flicker, metacontrast control, which allows you to create a display that alternates between the illusion of solid black and white 'transparency', or between the illusion of solid white and black 'transparency', with a particular flicker rate. The default display is 'keymacro flicker 1', but you can create your own by using the MetaChord Editor 77a5ca646e

Twizla Crack+ (Updated 2022)

Twizla is a tool that creates displays with dynamic, evolving colours and visual effects, accompanied by music and sound. Twizla includes a variety of preset displays, and can load and play displays created by other users and distributed as Twizla files. In some ways, Twizla displays are similar to the visualizations featured in some music players. However, visualizations tend to be provided as an optional, add-on extra, secondary to the music. With Twizla, the visuals are every bit as important as the sound. The flickering patterns create a pleasant, strobe-like effect and can be enjoyed simply as entertainment. However, the flickering occurs in the same frequency range (1 to 20 Hz.) used to categorize electrical activity in the brain (alpha, beta, delta and theta waves), and one of the audio outputs is a binaural beat which tracks the flicker rate. Thus Twizla may be used as a tool to experiment with so-called brainwave entrainment. Twizla is designed for entertainment. No specific claims are made as to the medical or other effects of running this software. Twizla does produce visual flickering that may be uncomfortable for some people. The application adds a new panel to the system tray. When it is launched the application will automatically create a new display. Displays can be created using the new panel and saved to file using the built-in Save As option. In the drop down list you can choose to save the display as an animation, video, or a text file. Also note that when you exit the application the display will be automatically saved to file. You can change the file name, format and filename format in the Options dialog.
