PDFTextStream Crack [Mac/Win]

PDFTextStream allows a developer to read, parse, and get the text content of a PDF document. PDFTextStream for Java and .NET both offer the same features and performance for extracting all the text and metadata you need from a PDF file. PDFTextStream for Java provides the following features: Integrated PDF metadata reader: PDFTextStream for Java is built to parse metadata. By leveraging the PDF standard, we have been able to create a metadata reader that is fully compliant with the PDF specification. PDFTextStream for Java can extract the following metadata items from PDFs: Apparent Type Name: (now known as Document Type), the Object Identifier (OCG), Icon, and the Title. Other metadata items, such as creation date, author, pages, keywords, and more. Value Indexed Text content: The content is extracted directly into the native .NET or Java word and line stream (structured text format).

PDFTextStream for Java reads and parses all the text in the file, then stores that text as a byte stream, in standard .NET or Java word and line format. Document display: PDFTextStream for Java enables you to manipulate and display all of the extracted text, metadata, and form data in the document. You can choose to display all the text, metadata, or form data independently, or you can display all three types of content together. PDFTextStream for Java will always return to you the structured text data. Extension PDF content: PDF content can be embedded in a PDF file. By analyzing and identifying the embedded PDF content in the file, PDFTextStream for Java can extract that content.

PDFTextStream for Java has been designed and tested to function on PDF documents as small as 1-3 MB. PDFTextStream can also be used for files larger than 3 MB, but will incur additional time and system resource usage.

PDFTextStream also provides a direct, simple, and stable method of extracting text directly from a PDF file: Keyword Search: PDFTextStream for Java provides a keyword search and highlight functionality that enables you to search for specific keywords and titles in any PDF file, and to locate all the text that matches those keywords in the document. PDFTextStream for Java only requires that you pass in a keyword list, and returns the extracted text in the same structure as is returned from the built-in PDFReader API.

PDFTextStream for Java also includes a comprehensive list of standard PDF keywords

PDFTextStream Crack Activation Download For PC

PDFTextStream is a powerful library for .NET and Java designed to enable you to get the text, metadata, and form data you need from PDF documents. PDFTextStream includes PDFTextStream for Java and PDFTextStream for .NET. PDFTextStream for Java is written in 100% pure Java, with no native components or dependencies. Its only requirement is a compliant Java 1.4 (or higher) JVM. PDFTextStream for Java is suitable for use in demanding desktop and server applications, including those with significant concurrency requirements. It has been designed to be amenable to parallelization, so that you can fully utilize your hardware and infrastructure investments when processing PDF documents without worrying about locking or race conditions. Of course, being a Java library, PDFTextStream may be used by any JVM language that supports interoperability with Java APIs, including Clojure, Scala, Groovy, JRuby, Jython, and so on. PDFTextStream for .NET is produced by translating the standard PDFTextStream for Java binary into a pure managed .NET assembly. This translation process is complete, and does not entail any side effects that impair the functionality, robustness, API's, or performance of PDFTextStream for .NET. All of the concurrency and parallelism guarantees provided by PDFTextStream for Java apply to its .NET cousin. As with PDFTextStream for Java, PDFTextStream for .NET may be used by any .NET language, including C#, VB.NET, F#, managed C++, and so on. [More]

PDFTextStream is a powerful library for .NET and Java designed to enable you to get the text, metadata, and form data you need from PDF documents. PDFTextStream includes PDFTextStream for Java and PDFTextStream for .NET. PDFTextStream for Java is written in 100% pure Java, with no native components or dependencies. PDFTextStream Download

PDFTextStream for.NET is a pure managed library for reading and writing PDF text streams in.NET. This library allows you to use C# and VB.NET to read and write plain text, metadata, form fields, and more. If your application needs more functionality, PDFTextStream for.NET gives you the ability to use the Document Object Model (DOM) to read and write any stream in a PDF document. PDFTextStream for.NET is able to read and write all of the most important forms, including form fields and comments. PDFTextStream for.NET can read the ExternalResources dictionary and, for each resource, read the embedded document reference, embedded font, and XObject.

PDFTextStream for.NET can even read and write PDF annotations, including the page numbers and cross-reference lists found in PDF documents. Features PDFTextStream for.NET is designed for.NET and Java, so it has the same features as PDFTextStream for Java: Text (plain-text) content, metadata, form fields, and any other kinds of data, such as images, embedded fonts, and XObjects, may be read and written using either the Document Object Model (DOM) or the object model. You can use this library in both desktop and server environments. PDFTextStream for.NET supports UTF-8, UTF-16, and UTF-16BE and UTF-32 and UTF-32BE. The library is ready to read and write XML documents. The PDFTextStream for.NET library is suitable for use in demanding desktop and server applications, including those with significant concurrency requirements. PDFTextStream for.NET has been designed to be amenable to parallelization, so that you can fully utilize your hardware and infrastructure investments when processing PDF documents without worrying about locking or race conditions. PDFTextStream for.NET is fully scalable. Unlike PDFTextStream for Java, which is designed to handle large numbers of concurrent requests by operating in a single-threaded fashion, PDFTextStream for.NET utilizes the capabilities of the Common Language Runtime (CLR) and the.NET framework to operate in a multi-threaded fashion. In this way, the library can automatically scale to any number of clients. For this reason, PDFTextStream for.NET may be useful for applications that require high-throughput, as well as those that require high-availability. The following table

shows the main features of PDFTextStream for .NET and PDFText

What's New In?

PDFTextStream is a highly efficient library for text extraction from PDF documents. It does so by means of a Java or .NET library that computes what the equivalent Tagged PDF (TX) command would look like for a given PDF document. PDFTextStream is simple to use, but some PDF documents are more difficult to parse than others. As a result, PDFTextStream requires one or more template(s) to provide the grammar and other knowledge required to parse PDF files. Each template may be written in any JVM language. Clojure, Scala, Groovy, JRuby, Jython, or any other JVM-based language may be used. The same is true for .NET languages; any language that supports interoperability with .NET APIs may be used. PDFTextStream uses Unicode text analysis to take advantage of the full Unicode character set in the language of the source code. PDFTextStream does not rely on the presence of language-specific text normalization or character set conversion. This means that it will work just as well with the Windows-1252 character set, as it will with Unicode, provided that the documents to be parsed are in UTF-8 format, and the text you extract is in the same format. PDFTextStream includes a compiler that generates a TX Stream that is appropriate for extracting the text, metadata, and form data you need from PDF documents. If you run the compiler in verbose mode, you can view the individual commands and instructions that are generated.

Requirements: PDFTextStream requires a compliant Java 1.4 (or higher) JVM. PDFTextStream for Java is compatible with the Sun Microsystems reference implementations (1.4, 5, 5.0, 6, 6.0, 7, 7.0, and JDK 1.5), Oracle's HotSpot Java implementation (1.4, 1.5, and 1.6), the GNU Classpath version of Java (GNU Java 1.4, 1.5, and 1.6), and other implementations. PDFTextStream for Java supports all standard Java language keywords, including constructors, classes, methods, strings, arrays, arrays of arrays, and so on. PDFTextStream for Java supports Java language for loops and other control constructs, as well as the standard Java collections, such as Map and Set. PDFTextStream has been tested with the latest version of Sun Java 5, Sun Java 6, Oracle's HotSpot Java version 1.4, and the GNU Classpath version of Java 1.4, 1.5, and 1.6. License:
